

ProcessMaster FEP300 Electromagnetic Flowmeter

The process industry's first choice

Intuitive operation

- Softkey-based functionality
- “Easy Set-up” function

Non-contact buttons

- Parameterization of the device without the need to open the housing

Diagnostics for real-life situations

- Status messages in accordance with NAMUR
- Help texts in the display

Maximum measuring accuracy

- Maximum measuring error: 0.2 % of rate

Universal transmitter

- Reduces spare parts inventory costs and storage costs

Flowmeter sensor featuring state-of-the-art memory technology

- Prevents errors and enables quick and reliable commissioning

Approvals for explosion protection

- In accordance with ATEX, IECEx
- In accordance with FM, cFM, NEPSI, GOST

HART, PROFIBUS PA, FOUNDATION Fieldbus

- Access to all status information

ABB

ABB is an established world force in the design and manufacture of instrumentation for industrial process control. Worldwide presence, comprehensive service and application-oriented know-how make ABB a leading supplier of flow measurement products.

Introduction**The industrial standard**

ProcessMaster is designed specifically to meet the increased requirements on advanced flowmeters. The modular design concept offers flexibility, cost-saving operation and reliability whilst providing a long service life and exceptionally low maintenance.

Integration into ABB asset management systems and usage of the self-monitoring and diagnostic functions increase the plant availability and reduce downtimes.

Advanced diagnostic functions

Using its advanced diagnostic functions, the device monitors both its own operability and the process.

Limit values for the diagnostic parameters can be set locally. When these limits are exceeded, an alarm is tripped.

For further analysis, the diagnostic data can be read out via an advanced DTM. Critical states can, thus, be recognized early and appropriate measures can be taken.

As a result, productivity is increased and downtimes are avoided.

The status messages are classified in accordance with the NAMUR recommendations.

In the event of an error, a diagnostic-dependent help text appears on the display which considerably simplifies and accelerates the troubleshooting procedure. The gives maximum safety for the process.

Superior and reliable new flowmeter sensor design

Self-cleaning, double-sealed polished measuring electrodes enhance the device's reliability and performance.

Using a higher excitation frequency for the transmitter, ProcessMaster is a flowmeter with an especially short response time. With its advanced filtering methods, the device improves accuracy even under difficult conditions by separating the noise from the measuring signal. This leads to a max. measuring error of 0.2 % of rate.

Easy and quick commissioning

Advanced data storage inside the sensor eliminates the need to match sensor and transmitter in the field. The on-board sensor memory automatically identifies the transmitter. On power-on, the transmitter self-configuration function is run, and replicates all sensor data and TAG-specific parameters into the transmitter. This eliminates the opportunity for errors and leads to an increased startup speed and reliability.

Intuitive, convenient navigation

The factory-set parameters can be modified quickly and easily via the user-friendly display and the non-contact buttons, without opening the housing. The "Easy Set-up" function reliably guides unpracticed users through the menu step by step.

The softkey-based functionality makes handling a breeze - it's just like using a cell phone. During the configuration, the permissible range of each parameter is indicated on the display and invalid entries are rejected.

Universal transmitter - powerful and flexible

The backlit display can be easily rotated without the need for any tools. The contrast is adjustable and the display fully configurable. The character size, number of lines and display resolution (number of decimals) can be set as required. In multiplex mode, several different display options can be pre-configured and invoked one after the other.

The smart modular design of the transmitter unit allows for easy disassembly without the need to unscrew cables or unplug connectors.

Whether count pulses, 20 mA signals or the status output are active or passive, the universal transmitter always delivers the correct signal. HART is used as the standard protocol.

Optionally, the transmitter is available with PROFIBUS PA or FOUNDATION Fieldbus communication.

The universal transmitter simplifies the spare parts inventory and reduces the stockholding costs.

ScanMaster - the diagnostic tool

Can I rely on the measured values?

How can I determine the technical condition of my device?

ScanMaster can answer these frequently asked questions.

And ScanMaster allows you to easily check the device for proper functioning.

ProcessMaster - always the first choice

ProcessMaster sets the standard for the process industry. It meets the various requirements of NAMUR. ProcessMaster is a universal device according to the Pressure Equipment Directive. In compliance with the requirements of NAMUR, the devices are categorized under category III for pipelines. As a result, ProcessMaster can be used universally. This reduces costs and increases safety.

Overview of the ProcessMaster series

ProcessMaster is available in two series.

ProcessMaster 300 with basic functionality and ProcessMaster 500 with extended functions and options. The following table gives an overview.

	ProcessMaster	
	FEP300	FEP500
Measuring accuracy 0.4 % (optionally 0.2 %) of rate	X	-
Measuring accuracy 0.3 % (optionally 0.2 %) of rate	-	X
Batch functions Presetting counter, overrun correction, external start/stop, batch end contact	-	X
Other software functions Mass units, editable counter,	X	X
Two measuring ranges	-	X
Graphic display Line recorder function	X	X
Diagnostic functions Detection of gas bubbles or deposits on electrodes, conductivity monitoring, temperature monitoring, finger print, trend	-	X
Partially filled Recognition through partial filling electrode (TFE)	X	X
Hardware options Versions for extremely abrasive fluids: • Ceramic carbide liner, • Wolfram carbide electrodes, • Double layer electrodes	-	X
Startup functions Grounding check	-	X
Fieldbus PROFIBUS PA, FOUNDATION Fieldbus	X	X
Verifications / Diagnostic tool ScanMaster	X	X

This data sheet describes ProcessMaster 300.

2 Performance specifications

2.1 General

2.1.1 Reference conditions according to EN 29104

Fluid temperature	20 °C (68 °F) ± 2 K
Ambient temperature	20 °C (68 °F) ± 2 K
Supply power	Nominal voltage acc. to name plate $U_n \pm 1\%$, frequency $f \pm 1\%$
Installation conditions	<ul style="list-style-type: none"> - Upstream >10 x DN, straight section - Downstream >5 x DN, straight section
Warm-up phase	30 min.

2.1.2 Maximum measuring error

Impulse output

- Standard calibration:
± 0.4 % of measured value, ± 0.02 % $Q_{max, DN}$
(DN 3 ... 2000)
- Optional calibration:
± 0.2 % of measured value, ± 0.02 % $Q_{max, DN}$
(DN 10 ... 600, 800)

$Q_{max, DN}$: See table in Section 2.4, "Flowmeter sizes, flow range".

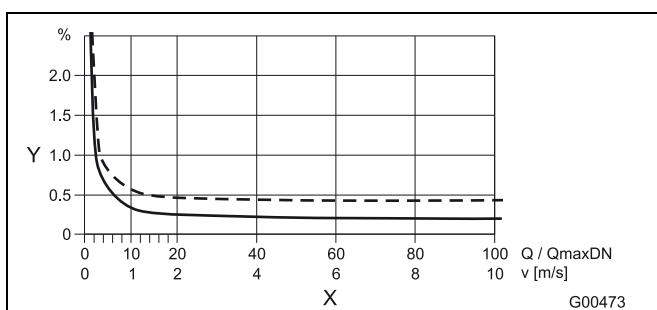

Fig. 1

Y Accuracy ± of measured value in [%]
X Flow velocity v in [m/s], $Q / Q_{max, DN}$ [%]

Analog output effects

Same as pulse output plus ± 0.1 % of measured value ± 0.01 mA

2.2 Reproducibility, response time

Reproducibility	≤ 0.11 % of measured value, $t_{meas} = 100$ s, $v = 0.5 \dots 10$ m/s
Response time of current output with damping of 0.02 seconds	As step function 0 ... 99 % $5 \tau \geq 200$ ms at 25 Hz excitation frequency $5 \tau \geq 400$ ms at 12.5 Hz excitation frequency $5 \tau \geq 500$ ms at 6.25 Hz excitation frequency

2.3 Transmitter

2.3.1 Electrical properties

Supply power	AC 100 ... 230 V (-15 % / +10 %) AC 24 V (-30 % / +10 %) DC 24 V (-30 % / +30 %), ripple: < 5 %
Line frequency	47 ... 64 Hz
Excitation frequency	6 1/4 Hz, 7 1/2 Hz, 12 1/2 Hz, 15 Hz, 25 Hz, 30 Hz (50 / 60 Hz power supply)
Power consumption	(flowmeter sensor including transmitter) AC $S \leq 20$ VA DC $P \leq 12$ W (switch-on current 5.6 A)
Electrical connection	Screw terminals

2.3.1.1 Isolation of input/outputs

The current output, digital outputs DO1 and DO2, and digital input are electrically isolated from the flowmeter sensor input circuit and from each other. The same is valid for the signal outputs of the versions with PROFIBUS PA and FOUNDATION Fieldbus.

2.3.1.2 Empty pipe detection

The "empty pipe detection" function requires:

A conductivity of the measured fluid $\geq 20 \mu\text{S}/\text{cm}$, a signal cable length ≤ 50 m (164 ft), a nominal diameter $DN \geq DN 10$, and the flowmeter sensor must not be provided with a preamplifier.

2.3.2 Mechanical properties

Integral mount design (transmitter mounted directly on the flowmeter sensor)	
Housing	Cast aluminum, painted
Paint	Paint coat $\geq 80 \mu\text{m}$ thick, RAL 9002 (light gray)
cable gland used	Polyamide, stainless steel (version for ambient temperature -40 °C (40 °F))
Remote mount design	
Housing	Cast aluminum, painted
Paint	Paint coat $\geq 80 \mu\text{m}$ thick, mid-section RAL 7012 (dark gray), front cover/rear cover RAL 9002 (light gray)
cable gland used	Polyamide, stainless steel (version for ambient temperature -40 °C (40 °F))
Weight	4.5 kg (9.92 lb)

2.3.2.1 Storage temperature, ambient temperature

Ambient temperature

-20 ... 60 °C (-4 ... 140 °F) standard

-40 ... 60 °C (-40 ... 140 °F) Advanced mode

Storage temperature

-40 ... 70 °C (-40 ... 158 °F)

2.3.2.2 Protection class for transmitter housing

IP 65, IP 67, NEMA 4X

2.3.2.3 Vibration according to EN 60068-2

Transmitter

- In the range 10 ... 58 Hz with max. 0.15 mm (0.006 inch) deflection*
- In the range 58 ... 150 Hz max. 2 g acceleration*

* = Peak load

2.4 Flowmeter sizes, flow range

The flow range end value can be set between $0.02 \times Q_{\max, DN}$ and $2 \times Q_{\max, DN}$.

Nominal diameter DN	"	Min. flow range end value $0.02 \times Q_{\max, DN} (\approx 0.2 \text{ m/s})$	$Q_{\max, DN}$ $0 \dots \approx 10 \text{ m/s}$	Max. flow range end value

3 Functional specifications

3.1 Flowmeter sensor

3.1.1 Protection type according to EN 60529

IP 65, P 67, NEMA 4X

IP 68 (for external flowmeter sensors only)

3.1.2 Pipeline vibration according to EN 60068-2-6

The following applies to compact devices:

(transmitter mounted directly on the flowmeter sensor)

- In the 10 ... 58 Hz range with max. 0.15 mm (0.006 inch) deflection
- In the 58 ... 150 Hz range with max. 2 g acceleration

The following applies to devices with a separate transmitter:

Transmitter

- In the 10 ... 58 Hz range with max. 0.15 mm (0.006 inch) deflection
- In the 58 ... 150 Hz range with max. 2 g acceleration

Flowmeter sensor

- In the 10 ... 58 Hz range with max. 0.15 mm (0.006 inch) deflection
- In the 58 ... 150 Hz range with max. 2 g acceleration

3.1.3 Installation length

The flange devices comply with the installation lengths specified in VDI/VDE 2641, ISO 13359, or according to DVGW (process sheet W420, design WP, ISO 4064 short).

3.1.4 Signal cable (for external transmitters only)

A 5 m (16.4 ft) cable is supplied.

If you require more than 5 m (16.4 ft), a cable can be purchased using order number D173D027U01.

For the transmitter designed for use in Zone 1, Div 1 (model FET325), 10 m (32.8 ft) of signal cable is permanently connected to the transmitter.

Alternatively, the cable with order number AD173D031U01 can be used for transmitters without explosion protection (model FEP321, FEH321) from DN15 and for transmitters for use in Zone 2 (model FEP325, FEH325) from DN15.

Preamplifier

Max. signal cable length between flowmeter sensor and transmitter:

a) Without preamplifier:

- Max. 50 m (164 ft) for conductivity $\geq 5 \mu\text{S}/\text{cm}$

A preamplifier is required for cables $> 50 \text{ m}$ (164 ft).

b) With preamplifier

- Max. 200 m (656 ft) for conductivity $\geq 5 \mu\text{S}/\text{cm}$

3.1.5 Temperature range

Storage temperature

-40 ... 70 °C (-40 ... 158 °F)

1) For CIP/SIP cleaning, higher temperatures are permitted for limited time periods; refer to the table titled "Maximum permissible cleaning temperature".

2) Only China production site.

3) Only USA production site.

Max. permissible cleaning temperature

CIP cleaning	Sensor lining	T_{max}	T_{max} minutes	$T_{amb.}$
Steam cleaning	PTFE, PFA	150 °C (302 °F)	60	25 °C (77 °F)
Fluids	PTFE, PFA	140 °C (284 °F)	60	25 °C (77 °F)

If the ambient temperature is $> 25^\circ\text{C}$, the difference must be subtracted from the max. cleaning temperature. $T_{max} - \Delta^\circ\text{C}$.

($\Delta^\circ\text{C} = T_{amb} - 25^\circ\text{C}$)

Maximum ambient temperature as a function of fluid temperature**Important**

When using the device in explosion hazardous areas, the additional temperature specifications in the section titled "Ex relevant specifications" on the data sheet or in the separate Ex safety instructions (SM/FEX300/FEX500/ATEX/IECEx) or (SM/FEX300/FEX500/FM/CSA) must be observed.

Flowmeter sensor housing

	Standard
Housing	Dual-shell casing, cast aluminum, painted, paint coat, ≥ 80 µm thick, RAL 9002
DN 3 ... 400 (1/10 ... 16")	Welded steel design, painted, paint coat, ≥ 80 µm thick, RAL 9002
DN 450 ... 2000 (18 ... 80")	
Terminal box	Aluminum alloy, painted, ≥ 80 µm thick, light gray, RAL 9002
Meter tube	Stainless steel
cable gland used	Polyamide, stainless steel (version for ambient temperature -40 °C (40 °F))

Parts that do not come into contact with fluid (process connection)

	Standard	Option
DN 3 ... 15 (1/10 ... 1/2")	Stainless steel ¹⁾	-
DN 20 ... 400 (3/4 ... 16")	Steel (galvanized) ²⁾	Stainless steel ¹⁾
DN 450 ... 2000 (18 ... 80")	Steel (painted) ²⁾	-

The process connections are made of one of the materials listed below:

- 1) 1.4301 (AISI 304), 1.4307, 1.4404 (AISI 316L) 1.4435 (AISI 316L), 1.4541 (AISI 321) 1.4571 (AISI 316Ti), ASTM A182 F304, ASTM A182 F304L, ASTM A182 F316L, ASTM A182 F321, ASTM A182 F316Ti, ASTM A182 F316, 0Cr18Ni9, 0Cr18Ni10, 0Cr17Ni13Mo2, 0Cr27Ni12Mo3, 1Cr18Ni9Ti, 0Cr18Ni12Mo2Ti
- 2) 1.0038, 1.0460, 1.0570, 1.0432, ASTM A105, Q255A, 20#, 16Mn

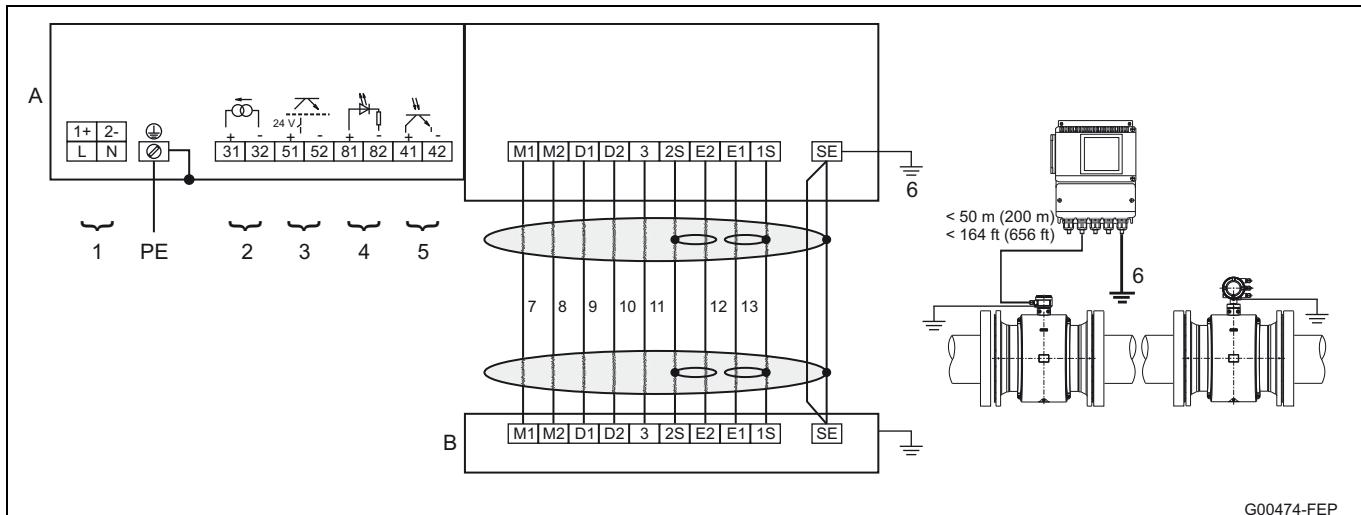

Fig. 8

- A **Transmitter**
B **Flowmeter sensor**

- 1 **Supply power**
See name plate

2 **Current output (terminals 31/32)**

The current output can be operated in "active" or "passive" mode.

- Active: 4 ... 20 mA, HART protocol (standard), load: $250 \Omega \leq R \leq 650 \Omega$
- Passive: 4 ... 20 mA, HART protocol (standard), load: $250 \Omega \leq R \leq 650 \Omega$

Supply voltage for the current output: minimum 11 V, maximum 30 V at terminals 31/32.

3 **Digital output DO1 (terminals 51/52) (pulse output or digital output)**

Function can be configured locally as "Pulse Output" or "Digital Output" using software. Factory setting is "Pulse Output".

The output can be configured as an "active" or "passive" output.

Configuration is performed using software.

- Configuration as pulse output.

Max. pulse frequency: 5250 Hz.

Pulse width: 0.1 ... 2,000 ms.

The pulse factor and pulse width are interdependent and are calculated dynamically.

- Configuration as contact output

Function: System alarm, empty pipe alarm, max./min. alarm, flow direction signaling, other

- Configuration as "active" output

$U = 19 \dots 21 \text{ V}$, $I_{\max} = 220 \text{ mA}$, $f_{\max} \leq 5,250 \text{ Hz}$

- Configuration as "passive" output

$U_{\max} = 30 \text{ V}$, $I_{\max} = 220 \text{ mA}$, $f_{\max} \leq 5250 \text{ Hz}$

4 **Digital input (terminals 81/82) (contact input)**

Function can be configured locally using software:

External output switch-off, external totalizer reset, external totalizer stop, other

Data for the optocoupler: $16 \text{ V} \leq U \leq 30 \text{ V}$, $R_i = 2 \text{ k}\Omega$

5 **Digital output DO2 (terminals 41/42) (pulse output or digital output)**

Function can be configured locally as "Pulse Output" or "Digital Output" using software.

Factory setting is "Digital Output", flow direction signaling.

The output is always a "passive" output (optocoupler).

Data for the optocoupler: $U_{\max} = 30 \text{ V}$, $I_{\max} = 220 \text{ mA}$, $f_{\max} \leq 5250 \text{ Hz}$

Digital communication

The transmitter has the following options for digital communication:

HART protocol

The unit is registered with the HART Communication Foundation.

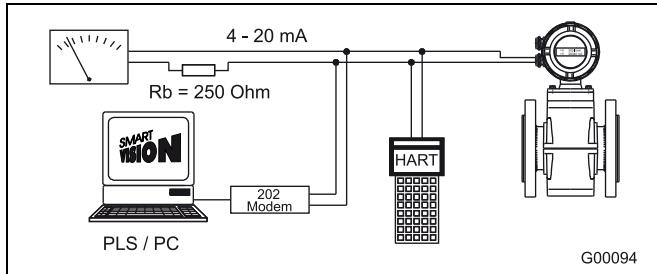

Fig. 17

HART protocol

Configuration	Directly on the device Software DAT200 Asset Vision Basic (+ HART-DTM)
Transmission	FSK modulation on current output 4 ... 20 mA acc. to Bell 202 standard
Max. signal amplitude	1.2 mA _{ss}
Current output load	Min. 250 Ω, max. = 560 Ω
Cable	AWG 24 twisted
Max. cable length	1500 m
Baud rate	1,200 baud
Display	Log. 1: 1200 Hz Log. 0: 2200 Hz

For additional information, see the separate interface description.

System integration

In conjunction with the DTM (Device Type Manager) available for the device, communication (configuration, parameterization) can occur with the corresponding framework applications according to FDT 1.21 (DAT200 Asset Vision Basic).

Other tool/system integrations (e.g., Emerson AMS/Siemens PCS7) are available upon request.

A free of charge version of the DAT200 Asset Vision Basic framework application for HART® or PROFIBUS is available upon request.

The required DTMs are contained on the DAT200 Asset Vision Basic DVD or in the DTM Library.

They can also be downloaded from www.abb.com/flow.

PROFIBUS PA protocol

The interface conforms to profile 3.01 (PROFIBUS standard, EN 50170, DIN 19245 [PRO91]).

Bus topology

- Tree and/or line structure
- Bus termination: passive at both ends of the main bus line (RC element R = 100 Ω, C = 1 μF)

Voltage / current consumption

- Average current consumption: 10 mA
- In the event of an error, the integrated FDE function (=Fault Disconnection Electronic) integrated in the device ensures that the current consumption can rise to a maximum of 13 mA.
- The upper current limit is restricted electronically.
- The voltage on the bus line must lie in the range of 9 ... 32 V DC.

For additional information, see the separate interface description.

System integration

ABB provides three different GSD files (equipment master data) which can be integrated in the system.

Users decide at system integration whether to install the full range of functions or only part.

The change-over is done using the "ID-number selector" parameter.

ID number 0x9700, GSD file name: PA139700.gsd

ID number 0x9740, GSD file name: PA139740.gsd

ID number 0x3430, GSD file name: ABB_3430.gsd

Bus address

The bus address is automatically assigned or can be set in the system manually.

The identifier (ID) is formed using a unique combination of manufacturer ID, device ID, and device serial number.

System integration

The following are required:

- DD (Device Description) file, which includes the device description.
- The CFF (Common File Format) file is required for engineering the segment. Engineering can be performed online or offline.

The interface description appears on the CD included in the scope of supply.

4 Ex-relevant specifications for operation in zones 1, 21, 22 / Div. 1

4.1 General

Devices with model names FEP315 and FEP325 are approved for operation in the following potentially explosive areas:

- ATEX/IECEx Zone 1, 21, 22
- FM Div.1
- cFM Div.1
- NEPSI Zone 1
- GOST Zone 1

Important

For detailed information on the individual approvals, refer to Section 1, "ProcessMaster 300 - Overview of technology".

Important

The housing for the transmitter and flowmeter sensor must be connected to the potential equalization PA. The operator must ensure that when connecting the protective conductor (PE) no potential differences can occur between protective conductor and potential equalization (PA).

A temperature of 70 °C (158 °F) at the cable entry is assumed for the Ex calculations.

Therefore, the cables used for the supply power and the signal inputs and outputs must have a minimum specification of 70 °C (158 °F).

For devices with remote mount design for use in FM / cFM Div. 1 or FM / cFM Div. 2 the signal cable between the flowmeter sensor and the transmitter must have a minimum length of 5 m (16.4 ft).

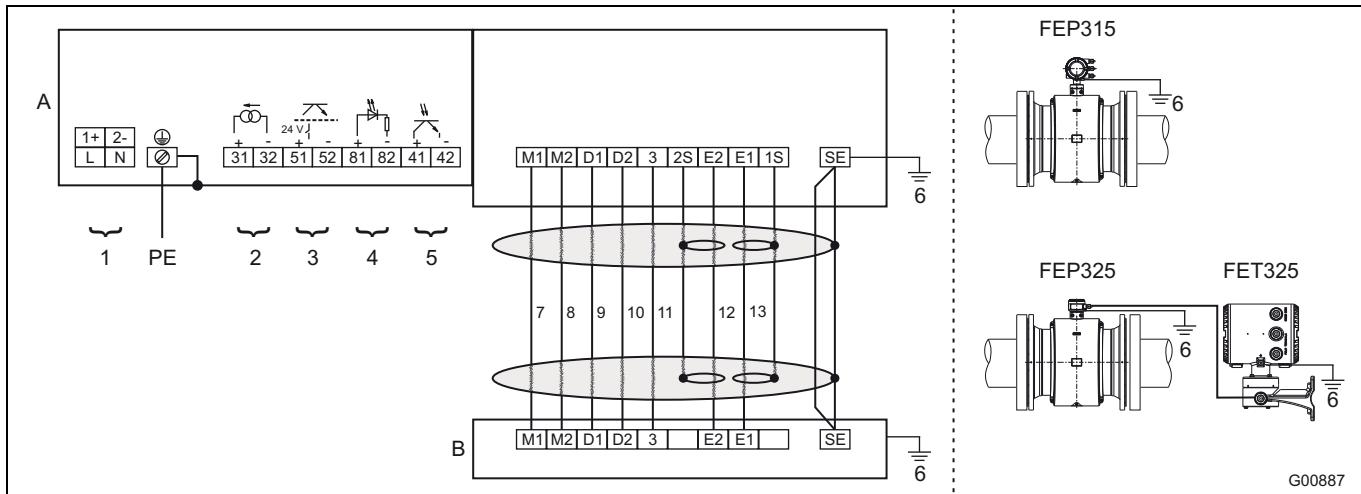

Fig. 20

- A **Transmitter**
B **Flowmeter sensor**

1 **Supply power:**

See name plate

2 **Current output (terminals 31/32)**

Dependent upon the device design, an "active" or a "passive" output will be available.

For devices designed for use in Ex Zone 1, the current output cannot be reconfigured locally.

- Active: 4 ... 20 mA, HART protocol (standard), load: $250 \Omega \leq R \leq 300 \Omega$
- Passive: 4 ... 20 mA, HART protocol (standard), load: $250 \Omega \leq R \leq 650 \Omega$, Supply voltage for the current output: minimum 11 V, maximum 30 V at terminals 31/32.

3 **Digital output DO1 (terminal 51/52)**

The output is always a "passive" output (optocoupler).

- Data for the optocoupler: $U_{max} = 30 V$, $I_{max} = 220 \text{ mA}$, Function can be configured locally as "Pulse Output" or "Digital Output" using software. Factory setting is "Pulse Output".
- Configuration as pulse output. Maximum pulse frequency: 5,250 Hz, pulse width: 0.1 ... 2,000 ms. The pulse factor and pulse width are interdependent and are calculated dynamically.
- Configuration as contact output. Function: System alarm, empty pipe alarm, max./min. alarm, flow direction signaling, other

4 **Digital input: (terminal 81/82)**

Only available in conjunction with "passive" current output.

Function can be configured locally using software: External output switch-off, external totalizer reset, external totalizer stop, other Data for the optocoupler: $16 V \leq U \leq 30 V$, $R_i = 2 k\Omega$

5 **Digital output DO2 (terminal 41/42)**

The output is always a "passive" output (optocoupler).

Data for the optocoupler: $U_{max} = 30 V$, $I_{max} = 220 \text{ mA}$

Function can be configured locally as "Pulse Output" or "Digital Output" using software. Factory setting is "Digital Output", flow direction signaling.

1) For "active" current output

2) For "passive" current output

3) Only available in conjunction with passive current output

4) Intrinsically safe single-channel or multi-channel barriers (supply isolators) with resistance characteristic must be used.

All inputs and outputs are electrically isolated from each other and from the supply power.

Special connection conditions:

The output circuits are designed in such a way that they can be connected to both intrinsically-safe and non-intrinsically-safe circuits. It is not permitted to combine intrinsically safe and non-intrinsically safe circuits. On intrinsically safe circuits, equipotential bonding must be in place along the entire length of the cable used for the current outputs.

The rated voltage of the non-intrinsically safe circuits is $U_M = 60$ V.

Provided that rated voltage $U_M = 60$ V is not exceeded if connections are established to non-intrinsically safe external circuits, intrinsic safety is still guaranteed.

4.3.2 Devices with PROFIBUS PA or FOUNDATION Fieldbus

When operating in potentially explosive areas, observe the following electrical data for the signal inputs and outputs of the transmitter. For the correct design (PROFIBUS PA or FOUNDATION Fieldbus), see the marking contained in the device's terminal box.

Model: FEP315 or FET325

The fieldbus (terminal 97 / 98) and the digital output (terminal 41 / 42) can be connected in Zone 1 / Div. 1 in three different variants.

4.4 Temperature values

Model name	Surface temperature
FEP315	70 °C (158 °F)
FEP325	85 °C (185 °F)
FET325	70 °C (158 °F)

The surface temperature depends on the fluid temperature.

With increasing fluid temperature > 70 °C (158 °F) or > 85 °C (185 °F) the surface temperature also increases to the level of the fluid temperature.

Important

The maximum permissible fluid temperature depends on the lining and flange material, and is limited by the operating values in Table 1 and the explosion protection specifications in Tables 2 ... n.

Table 1: Fluid temperature as a function of lining and flange material

4.5 Special features of version designed for operation in Ex zone 1 / Div. 1

4.5.1 Configuring the current output

For devices designed for use in Ex Zone 1 / Div.1, the current output cannot be reconfigured subsequently.

The configuration required for the current output (active/passive) must be specified when the order is placed.

For the correct current output design (active/passive), see the marking contained in the device's terminal box.

4.5.2 Configuration of the digital outputs

For version designed for operation in Ex zone 1 / Div. 1, the digital outputs DO1 (51/52) and DO2 (41/42) can be configured on a NAMUR switching amplifier. On leaving the factory, the device is configured with the standard wiring (non-NAMUR).

Devices with PROFIBUS PA or FOUNDATION Fieldbus only have the digital output DO2 (41 / 42).

Important

The outputs' type of protection remains unaffected by this. The devices connected to these outputs must conform to the applicable regulations for explosion protection.

The jumpers are located on the backplane in the transmitter housing.

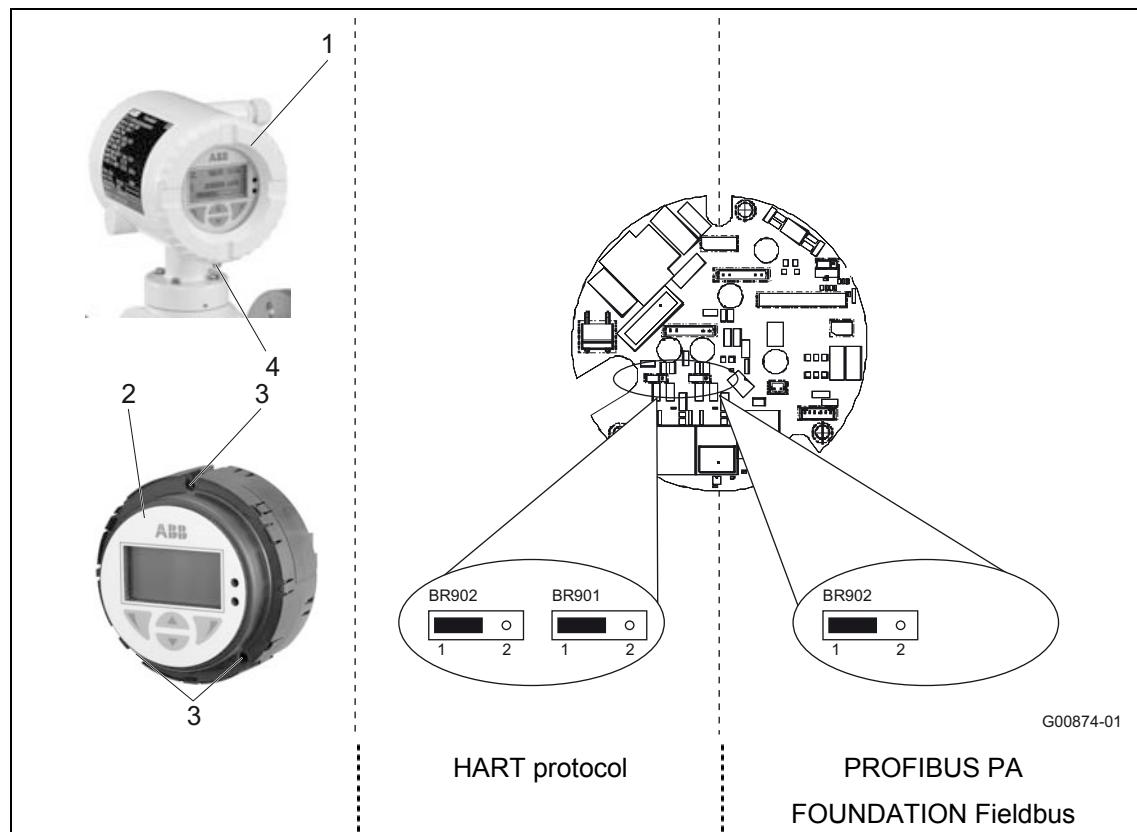

Fig. 24

BR902 in position 1: Standard (non-NAMUR) BR902 in position 2: NAMUR	BR901 in position 1: Standard (non-NAMUR) BR901 in position 2: NAMUR

Configure the digital outputs as described:

1. Switch off the supply power and wait at least 20 minutes before the next step.
2. Open the cover safety device (4) and housing cover (1).
3. Loosen screws (3) and pull out transmitter plug-in (2).
4. Insert the jumpers in the required positions.
5. Put the transmitter plug-in (2) back into the housing and retighten the screws (3).
6. Close the housing cover (1) and lock the cover by unscrewing the screw (4).

5 Ex-relevant specifications for operation in zones 2, 21, 22 / Div. 2

5.1 General

Devices with model names FEP315 and FEP325 are approved for operation in the following potentially explosive areas:

- ATEX/IECEx Zone 2, 21, 22
- FM Div.2
- cFM Div.2
- NEPSI Zone 2
- GOST Zone 2

Important

For detailed information on the individual approvals, refer to Section 1, "ProcessMaster 300 - Overview of technology".

A temperature of 70 °C (158 °F) at the cable entry is assumed for the Ex calculations.
Therefore, the cables used for the supply power and the signal inputs and outputs must have a minimum specification of 70 °C (158 °F).

2 **Current output (terminals 31/32)**

The current output can be configured locally as an "active" or "passive" output.

- Active: 4 ... 20 mA, HART protocol (standard), load: $250 \Omega \leq R \leq 650 \Omega$
 - Passive: 4 ... 20 mA, HART protocol (standard), load: $250 \Omega \leq R \leq 650 \Omega$
- Supply voltage for the current output: minimum 11 V, maximum 30 V at terminals 31/32.

3 **Digital output DO1 (terminal 51/52)**

The digital output can be configured locally as an "active" or "passive" output.

- Active: $U = 19 \dots 21 \text{ V}$, $I_{\max} = 220 \text{ mA}$, $f_{\max} \leq 5250 \text{ Hz}$
- Passive: $U_{\max} = 30 \text{ V}$, $I_{\max} = 220 \text{ mA}$, $f_{\max} \leq 5250 \text{ Hz}$

Function can be configured locally as "Pulse Output" or "Digital Output" using software. Factory setting is "Pulse Output".

- Configuration as pulse output. Maximum pulse frequency: 5,250 Hz, pulse width: 0.1 ... 2,000 ms. The pulse factor and pulse width are interdependent and are calculated dynamically.
- Configuration as contact output. Function: System alarm, empty pipe alarm, max./min. alarm, flow direction signaling, other

4 **Digital input: (terminal 81/82)**

Function can be configured locally using software: External output switch-off, external totalizer reset, external totalizer stop, other Data for the optocoupler: $16 \text{ V} \leq U \leq 30 \text{ V}$, $R_i = 2 \text{ k}\Omega$

5 **Digital output DO2 (terminal 41/42)**

The output is always a "passive" output (optocoupler).

Data for the optocoupler: $U_{\max} = 30 \text{ V}$, $I_{\max} = 220 \text{ mA}$, $f_{\max} \leq 5250 \text{ Hz}$

Function can be configured locally as "Pulse Output" or "Digital Output" using software. Factory setting is "Digital Output", flow direction signaling.

Model name	Surface temperature
FEP315	70 °C (158 °F)
FEP325	85 °C (185 °F)

6 Explosion protection specifications for operation in areas with combustible dust

6.1 Information about using the device in areas with combustible dust

The device is approved for use in potentially explosive areas (gas and dust).

The Ex certification is provided on the name plate.

Risk of explosion!

The dust explosion protection is also provided by the housing.

Modifications to the housing are not allowed (e.g., removing or omitting parts).

6.1.1 Maximum Allowable Surface Temperature

Model name	Maximum surface temperature
FEP325	T 85 °C (185 °F) ... T _{medium}
FEP315	T 70 °C (158 °F) ... T _{medium}
FET325	T 70 °C (158 °F)

The maximum surface temperature is applicable to dust layers of up to 5 mm (0.20 inch) in thickness. The minimum permissible ignition and smoldering temperatures of the dust atmosphere should be calculated in accordance with IEC61241ff.

With thicker dust layers, the maximum permissible surface temperature must be reduced. The dust can be conductive or non-conductive. IEC61241ff must be observed.

6.1.2 Min. signal cable length

In explosion protection areas, the signal cable cannot be shorter than 5 m (16.4 ft).

7 Installation requirements

7.1 Grounding

The flowmeter sensor must be connected to ground potential. For technical reasons, this potential should be identical to the potential of the metering fluid.

For plastic or insulated lined pipelines, the fluid is grounded by installing ground plates. When there are stray potentials present in the pipeline, a ground plate is recommended on both ends of the meter sensor.

7.2 Mounting

The following points must be observed for the installation:

- The meter tube must always be completely full.
- The flow direction must correspond to the identification if present.
- The maximum torque for all flange connections must be complied with. The max torque depends on the temperature, pressure, material of the flange bolts and gaskets and has to be chosen accordingly.
- The devices must be installed without mechanical tension (torsion, bending).
- Flowmeters with coplanar counter flanges may only be installed with suitable seals.
- Use flange seals made from a compatible material for the fluid and fluid temperatures.
- Seals must not extend into the flow area since possible turbulence could influence the device accuracy.
- The pipeline may not exert any unallowable forces and torques on the device.
- Do not remove the plugs in the cable connectors until you are ready to install the electrical cable.
- Install the separate converter at a largely vibration-free location.
- Do not expose the converter to direct sunlight or provide for appropriate sun protection where necessary.

The device measures the flowrate in both directions. Forward flow is the factory setting, as shown in Fig. 27.

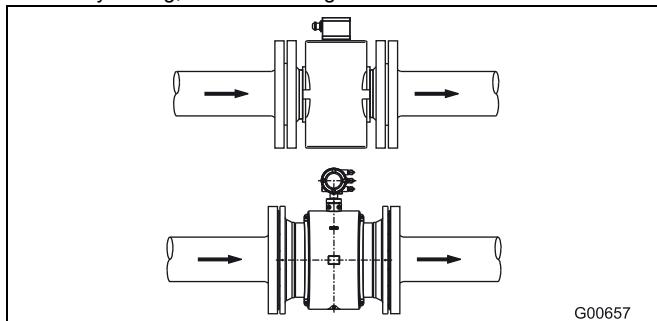

Fig. 27

7.2.1 Electrode axis

Electrode axis (1) should be horizontal if at all possible or no more than 45° from horizontal.

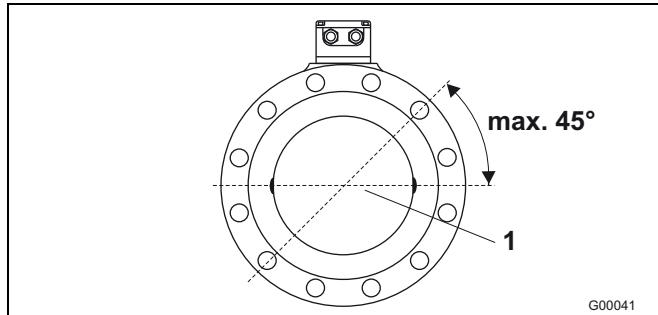

Fig. 28

7.2.2 In- and outlet pipe sections

Straight inlet section	Straight outlet section
$\geq 3 \times DN$	$\geq 2 \times DN$

DN = Flowmeter sensor size

- Do not install fittings, manifolds, valves etc. directly in front of the meter tube (1).
- Butterfly valves must be installed so that the valve plate does not extend into the flowmeter sensor.
- Valves or other turn-off components should be installed in the outlet pipe section (2).
- For compliance with the measuring accuracy, observe the inlet and outlet pipe sections.

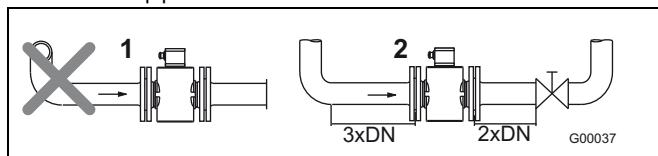

Fig. 29

7.2.3 Vertical connections

- Vertical installation for measurement of abrasive fluids, flow preferably from below to above.

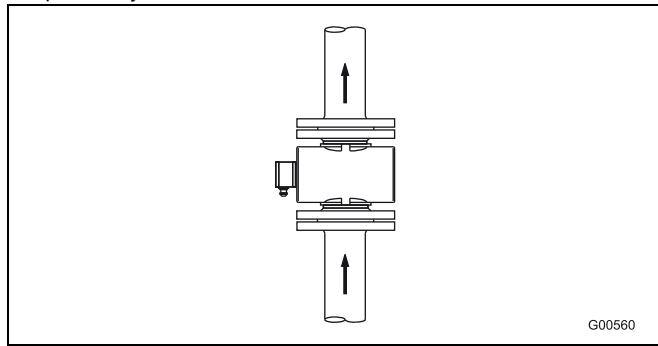

Fig. 30

7.2.4 Horizontal connections

- Meter tube must always be completely full.
- Provide for a slight incline of the connection for degassing.

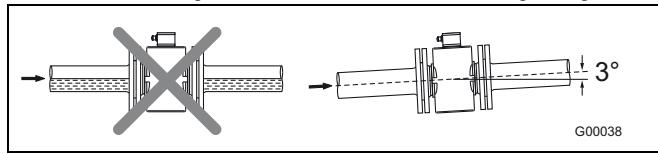

Fig. 31

7.2.5 Free inlet or outlet

- Do not install the flowmeter at the highest point or in the draining-off side of the pipeline, flowmeter runs empty, air bubbles can form (1).
- Provide for a siphon fluid intake for free inlets or outlets so that the pipeline is always full (2).

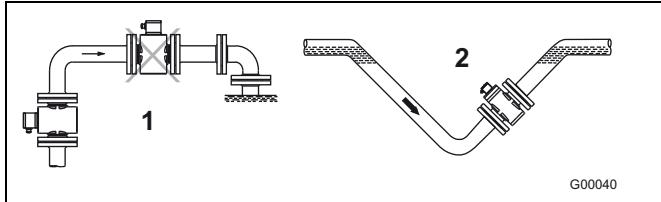

Fig. 32

7.2.6 Strongly contaminated fluids

- For strongly contaminated fluids, a bypass connection according to the figure is recommended so that operation of the system can continue to run without interruption during the mechanical cleaning.

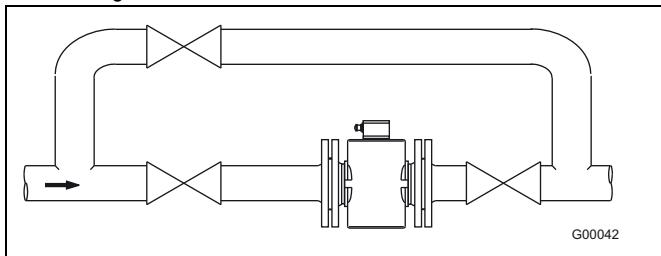

Fig. 33

7.2.7 Installation in the vicinity of pumps

- For flowmeter primaries which are to be installed in the vicinity of pumps or other vibration generating equipment, the utilization of mechanical snubbers is advantageous.

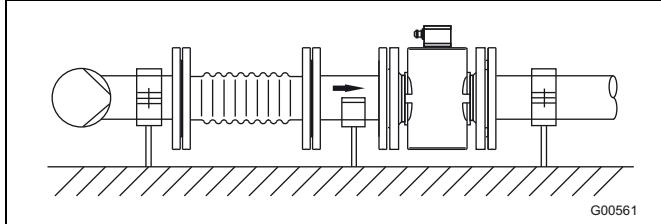

Fig. 34

7.2.8 Installing the high temperature design

The high temperature design allows for complete thermal insulation of the sensor. The pipeline and sensor must be insulated after installing the unit according to the following illustration.

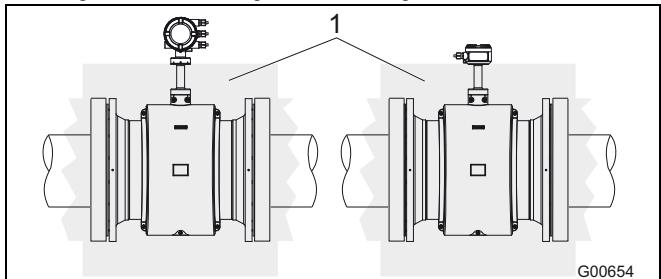

Fig. 35

1 Insulation

7.2.9 Installation in pipelines with larger nominal diameters

Determine the resulting pressure loss when using reduction pieces (1):

- Calculate the diameter ratio d/D .
- Determine the flow velocity based on the flow range nomograph (Fig. 37).
- Read the pressure drop on the Y-axis in Fig. 37.

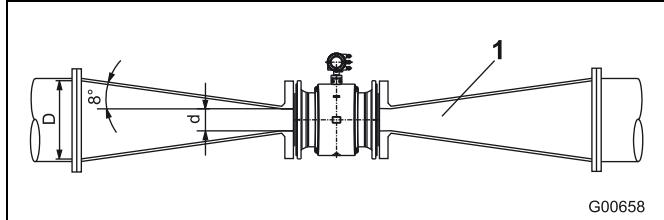

Fig. 36

- 1 = Flange transition piece
 d = Inside diameter of the flowmeter
 V = flow velocity [m/s]
 Δp = pressure loss [mbar]
 D = Inside diameter of the pipeline

Nomograph for pressure drop calculations

- 4) Available from DN 1000 (40 in.)
- 5) DN 15 ... DN 200 (1/2 ... 8 in.) Hard rubber.
- 6) Material: See data sheet.
- 7) Standard accuracy (0.4% of rate) assumes 2 calibration points. If more than 2 calibration points are required, you must specify 3 or 5 points under "Number of test points".
- 8) Increased accuracy (0.2% of rate) assumes 3 calibration points. If more than 3 calibration points are required, you must specify 5 points under "Number of test points". Available for DN10 (3/8 in.) ... 800 (32 in.)
- 9) Available for nominal diameters DN 50 (2 in.) ... 600 (24 in.), DN 800 (32 in.).
- 10) Maximum fluid temperature for standard sensor design: 130 °C with PTFE, PFA, ETFE, thick PTFE / 90 °C with hard rubber / 60 °C with soft rubber.
- 11) Maximum fluid temperature for high-temperature sensor design: 180 °C with PFA, thick PTFE. 130 °C with ETFE, PTFE. Thick PTFE available for DN 25 ... DN 300, PFA available for DN 10 ... DN 200.
